Summary

Software Engineer (AI/ML and Data) with two years at Goldman Sachs building Python backend services, RAG and semantic search with LLM evaluation, and Airflow and Spark pipelines on AWS. Builds tested LLM systems: a release gate with canary rollback, a multi-provider gateway with MCP agents, and a tool-calling agent. Runner-up, 2025 Florida AI for Good Hackathon.

Skills

Languages and data: Python, SQL, PostgreSQL, GraphQL, Pandas, Apache Spark, Apache Airflow, ETL, data pipelines
AI and LLMs: RAG, semantic search, embeddings, FAISS, pgvector, Hugging Face Transformers, Claude, Amazon Bedrock
LLM systems: model evaluation, agentic workflows, MCP tool calling, guardrails, LLM routing, prompt-injection testing
Backend and cloud: FastAPI, REST APIs, AWS (Lambda, S3, EC2, IAM), Docker, Kubernetes, CI/CD, Prometheus, pytest

Experience

Goldman Sachs Bengaluru, India
Software Engineer Nov 2022 – Jul 2024

- Built REST APIs in FastAPI, GraphQL services and SQL databases in PostgreSQL behind internal search tools for research analysts, gathering requirements with the analysts in Agile teams.
- Built RAG and semantic search (document ingestion, embeddings, retrieval, LLM evaluation) with Hugging Face Transformers and FAISS, improving retrieval relevance by 28%.
- Created validation datasets for model evaluation that tested outputs before release, cutting inaccurate results by 35%.
- Built Python ETL data pipelines in Apache Airflow that refreshed financial document data weekly with failure alerting; used Apache Spark and Pandas to clean tens of thousands of raw documents.
- Helped migrate services and data flows from on-prem to AWS (Lambda, S3, EC2, IAM) with Docker, Kubernetes and CI/CD.
- Monitored services with CloudWatch, Prometheus and Grafana; did root-cause analysis with the infrastructure team and followed release, patching and rollback steps.

Projects

Gauntlet – release gate for LLM apps | *Python, FastAPI, Kubernetes* github.com/Cibisid/gauntlet

- Built a release gate that scores a candidate prompt or model against the baseline on 514 held-out cases and blocks it on a paired-bootstrap non-inferiority test, a 40-case prompt-injection pack, or latency and cost budgets.
- Wrote a canary proxy with weighted routing, hashed API keys, rate limits, Prometheus metrics and automatic rollback; 137 pytest tests at 98% coverage, strict mypy, and Bandit, Semgrep and gitleaks scans in CI.

LLM Gateway & Agent Platform | *Python, FastAPI, Docker* github.com/Cibisid/llm-gateway

- Built an OpenAI-compatible gateway routing across Anthropic, OpenAI and Azure OpenAI adapters by cost, latency or priority, with automatic fallback and per-request cost on every response.
- Wrote an MCP server with 11 tools and a plan-act-observe agent that delegates over A2A; a 23-case eval harness and 167 pytest tests run in CI, with guardrails (auth, rate limiting, PII redaction).

TrialBridge – clinical-trial matching | *Python, PostgreSQL, pgvector, Bedrock* github.com/Cibisid/trialbridge

- Built a FastAPI matcher over 2,344 ClinicalTrials.gov trials: MiniLM embeddings in pgvector pull the top 50 candidates and a rules engine re-ranks them on a 60/40 semantic and eligibility score.
- Designed a Claude (Amazon Bedrock) tool-calling agent that reads patient facts only through 5 tools and answers UNKNOWN instead of guessing; 86 tests and a 15-case eval harness in CI.

AI for Good Hackathon, State of Florida (2025) – Runner-Up | *Python, machine learning* Statewide

- Team built ML models on housing data predicting income needed to buy a home, payments and how many could buy.

Education and Certifications

M.S. Computer Science (Data Science), University of North Florida, GPA 3.9/4.0 May 2026
B.Tech. Computer Science (Health Informatics), Vellore Institute of Technology, GPA 3.45
Certifications: AWS Certified Machine Learning Engineer – Associate; Salesforce Certified Platform Developer I
